AN ECONOMETRIC STRATEGIC MODEL FOR THE STRENGTHENING TO PACs IN INDIA

Dr. Nilima Rajaram Mirajkar Assistant Professor Department of Economics, Doshi Vakil Arts College & G.C.U.B. Science and Commerce College, Goregaon, Raigad.

ABSTRACT:

In Indian agriculture finance, primary agriculture cooperative societies are playing a very crucial role. Especially short term and medium-term loans are provided by the PACs at an affordable cost. These PACs are also firms that are making business in the rural area by considering the common interest of their members. They are also facing several problems while undertaking their day to day activities. The problem of overdue of the PACs is one of the burning issues therein. This problem is serious since overdue adversely affects the capacity of borrowing on the part of the cooperatives from the central financing agencies and consequently reduces their loan facilities to cultivators. The objective of an increase in production depends so much on the availability of the credit facilities to the cultivators to obtaining the much-needed inputs. This principle of strategic management is also applicable to the PACs though they are motivated by the common concern. Though the principle of strategic management is very much applicable to PACs, hardly a few PACs are aware of this principle and therefore they are unable to manage their problems like overdue. The present paper is attempted towards finding the answer to some the basic questions like, which type of strategy has to be adopted by PACs in order survive in the modern competitive era? How to overcome the weakness? How to receive benefits from strength? The answer to these questions was tried to solve with the help of a crosssection regression model and framing a strengthening model. A study has focused on the internal and external environment of the PACs along with qualitative, quantitative, and dummy variables. The strengthening model is a purely applied model that can be tested by using a well-designed questionnaire. In the present paper, the model is partially tested due to secondary data constraints.

KEYWORDS: Indian agriculture finance, strategic management, strengthening model.

I. INTRODUCTION

The growth of any firm or business institution mostly depends on the effective and appropriate strategy management by the firm. Proper strategy management will not be possible without the activeness of the management body and leadership. Every firm has to be aware of its strength, weakness, opportunities, and threats. Weakness and strengths are the internal forces that can be managed by using an appropriate strategic plan. Threats and opportunities are not under the control of the firm therefore it may say external negative and positive forces. Therefore there is negligible scope for strategic management in the external environment risk of the firm. To reduce the magnitude of the internal and external risk, a proper strategy has to be implemented by the firm. Strength is the key force of a firm, with the help of which the firm can grow smoothly. There are five steps in strategic management. These steps are the formulation

of the strategy, planning for strategy, implementation of strategy, evaluation of the strategy, and modification of the strategy.

In Indian agriculture finance, primary agriculture cooperative societies are playing a very crucial role. Especially short term and medium-term loans are provided by the PACs at an affordable cost. These PACs are also firms that are making business in the rural area by considering the common interest of their members. They are also facing several problems while undertaking their day to day activities. The problem of overdubs of the PACs is one of the burning issues therein. This problem is serious since overdue adversely affects the capacity of borrowing on the part of the cooperatives from the central financing agencies and consequently reduces their loan facilities to cultivators. The objective of an increase in production depends so much on the availability of the credit facilities to the cultivators to obtaining the much-needed inputs. This principle of strategic management is also applicable to the PACs though they are motivated by the common concern. Though the principle of strategic management is very much applicable to PACs, hardly a few PACs are aware of this principle and therefore they are unable to manage their problems like overdue. The present paper is attempted towards finding the answer to some the basic questions like, which type of strategy has to be adopted by PACs in order survive in the modern competitive era? How to overcome the weakness? How to receive benefits from strength? The answer to these questions was tried to solve with the help of a cross-section regression model and framing a strengthening model.

The study has focused on the internal and external environment of the PACs along with qualitative, quantitative, and dummy variables. The strengthening model is a purely applied model that can be tested by using a well-designed questionnaire. In the present paper, the model is partially tested due to secondary data constraints.

II. OBJECTIVES OF THE STUDY

The major objectives of the present study are as below.

- 1. To frame a logical model for strengthening primary cooperative agriculture credit societies.
- 2. To test the validity and viability of the presented model to overcome the overdue.
- 3. To suggest appropriate policy implications to overcome overdue.

III. DATA BASE AND RESEARCH METHODOLOGY

The paper is based on secondary data. The necessary data has been collected from the various reports of the National Federation of State Cooperative Banks Ltd. (NAFSCB). The gathered data has been processed in Eviews software. A prominent statistical technique such as multiple regression analysis has been applied for the validity and viability testing of the model.

IV. APPLIED STRATEGIC MODEL FOR THE STRENGTHENING TO PACS

Strength may be defined as all those internal environmental forces of the firm which positively influence the growth of the firm (in our model PACs). These strengths can be classified into two broad categories namely qualitative and quantitative forces. The qualitative forces like goodwill of the PACs, Active and talented secretary, the belief of the members, experience of the management body, relations of PACs with the members and upper cooperative institution (District Cooperative Bank).

These qualitative forces cannot measurable though these forces are playing a very crucial role in the strengthening of PACs. The quantitative forces are all those forces that are measurable. These forces are namely growth of share capital, growth working capital, physical and financial assets, growth of deposits, demand for a loan, rate of profit, etc. Diagram 1 presents the framework of the strength of a PACs. This fundamental framework of the strength of PACs can reduce the intensity of internal risk and obtain the benefits from strength.

V. MODEL FOR OVERDUES MANAGEMENT

Overdue of primary agriculture credit societies are influenced by certain factors, which have been broadly categorized into external and internal factors¹. The external factors are those beyond the control of the beneficiaries and the credit societies. They are, for example, the agro-climatic conditions, irrigation facilities, cropping patterns, and the like. Failure of monsoon, untimely rainfall or excess rains, and such other calamities do adversely affect agriculture and reduce the capacity of the cultivators –members to repay their dues. Similarly, lack of irrigation facilities, consequently affecting their repaying capacity.

Some factors falling under the description of cropping patterns unique to a given area are also relevant. They are the proportion of area under cash crops to the gross area under cultivation, and the intensity of cropping. It is generally observed that a cultivator raising cash crops in his field is placed in a more favorable position to pay his dues to the credit society than one who does not raise such cash crops. Further, a cultivator who exploits his land much more than one who does not do so is likely to have a larger cash turnover to pay up the installments without incurring overdue.

The internal factors are those well within the control of the credit societies themselves. They are internal resources, organizational structure, and supervisory arrangement over recoveries. Internal resources are defined as share capital, membership fees, reserve funds, and deposits from members. If the internal resources from a large part of the total working capital of the society, the latter is in a position to meet its Overdue to the district central financing agency by diverting the internal resources from other uses.

¹ Reserve Bank of India : Report of the Study Team on Overdues of the Co-operative Credit Institutions, Agriculture Credit Department ,Bambay ,1974,Chapter II,PP.25-71

Though the purpose of further borrowing without obstruction would thus be facilitated the opportunity cost of internal resources in alternative uses is high. Being aware of this, the society may recover the overdue from its members to a greater extent than a society whose internal resources from a smaller proportion of the working capital.

Experience has been that if a credit society has a full time paid secretary and if the society is subject to frequent supervision by the district central co-operative bank, the overdue of such a society is likely to be far less than those of credit society being without a full time paid secretary and not subject to any supervision. Further, if the credit facility extended by society has been more in kinds such as fertilizers and seeds, there is a greater possibility of its being used directly as input I agriculture increasing the capacity of the cultivator to repay the installment to the society. Similarly, if there is any provision for the cultivator to repay at least some part of the loan through cooperative marketing society, by offering his produce, the chance of the recovery of the loan is ensured to a substantial extent.

The causes seemingly responsible for overdue as discussed above can be incorporated in a stochastic model to test their validity in the given situation. A functional relationship is formulated as below.

$$Y = f(X_1, X_2, X_3, X_4) \lambda$$

Where

Y= Overdues of primary agriculture cooperative society in rupees

 X_1 = The proportion of net irrigated area to the total net cultivated area covered by the society expressed in percentage.

 X_2 = The proportion of gross area under cash crops to the gross cultivated area covered by the society expressed in percentage.

 X_3 = The proportion of gross cultivated area to the net cultivated area covered by the society expressed in percentage.

 X_4 = The proportion of internal resources to working capital of the society in rupees.

 Λ = Represents the influence of the external forces.

In addition to the above four independent variables, dummy variables can be added to the regression equation sought to be fitted for the estimation purpose. They are

 D_1 = If the society disburses loan in kind and has facilities for selling fertilizers and other inputs, this will assume the value of unity and, if not, zero.

 D_2 = If the society has a full-time secretary, this will assume the value of unity and if not, zero.

 D_3 = If the society has been subject to supervision consistently, this will assume the value of unity and if not, zero.

 D_4 =If the repayment of the loan is linked with marketing, this will assume the value of unity and if not, zero. A cross-sectional multiple regression analysis of overdue of primary agriculture co-operatives societies incorporating the above explanatory variables has to be done on certain assumptions. They are:

- 1. In addition to the variables explained above, there may be some exogenous factors as well. For example, overdue may be caused by willful defaulters. It is not possible to capture the influence of such forces.
- 2. It is assumed that there is no or negligible degree of inter-society difference in the managerial skill of the secretaries wherever such secretaries are working.
- 3. The next assumption is regarding the quality of supervision over societies where such supervision is exercised. It is assumed that there is no or negligible degree of inter-society difference in the quality of supervision.
- 4. It is assumed that the inter-society soil-quality differences of land are also captured by the variable, cropping intensity, just as it reflects the application and hard work of the cultivator.

Under the above restrictive assumption, the following hypotheses are sought to be tested:

a) There is a negative relationship between the overdue of cooperative society and irrigation facilities obtained in the area covered by the society.

e.g
$$\left(\frac{\partial y}{\partial x \, 1} < 0\right)$$

b) The relationship between the overdue of the society and the proportion of area under cash crops to the area under total agricultural production raised in the area of the society is inverse $\left(\frac{\partial y}{\partial x^2} < 0\right)$

c) Cropping intensity has a negative influence on the overdue position of the society $(\frac{\partial y}{\partial x^3} < 0)$

d) Overdues of the society are inverse relationship with the proportion of internal resources to the total working capital of the society ($\frac{\partial y}{\partial x_4} < 0$)

e) Secretarial assistance to a society reduces the incidence of Overdues of the society $(\frac{\partial y}{\partial D_1} < 0)$

f) Effective supervision over society and the overdue of the society move in the opposite direction $\left(\frac{\partial y}{\partial D_{2}} < 0\right)$

g) Linking credit with marketing and overdue of the society are inversely related $(\frac{\partial y}{\partial D^3} < 0)$

h) Distribution of loan in kind has a negative influence on Overdue position $\left(\frac{\partial y}{\partial D^A} < 0\right)$

This model has to be tested by acquiring facts by a well-designing questionnaire. The next section deals with the application of the model to the overdue based on available secondary data.

VI. PARTIAL TESTING OF THE STRENGTHENING MODEL

Required primary data for proper testing of the model is not gathered for the present work. Therefore this model has been tested partially. To check the viability and validity of the model multiple regression techniques have been used. The quantitative data of PACs which truly determines the degree of strengthening has been identified and considered as an "explanator". These regressors are own fund, loan issued, paid-up capital, total deposits, total resources, and total reserves. The overdue was considered as a dependent or regressed variable and attempts were made to explore the validity of the model. Before explaining regression statistical inferences, it is essential to explain rough data. The table-1 depicted the financial position of PACs over a period of 10 years from 2002 to 2011. The table reveals that the number of PACs during the study period came down drastically, in 2002 it was 112309 lakh, which comes down to 92432 lakh in 2011. It implies that the existences of PACs are under threaten. The causes of threatens maybe differ from region to region. Continuous increasing overdue is a basic considerable issue of deteriorating of PACs.

VII. FINDINGS

As quantification is possible, some of these factors were incorporated in a stochastic model to find out the determinants of overdue. Paper focused attention on the analysis of overdue of primary agriculture cooperative societies. The following finding can be drawn based on regression results.

- 1. A time-series regression analysis of overdue from 2002 to 2011 reveals that except total issued loan coefficient, all other coefficients are negatively related to the overdue. It implies that with the strengthening of PACs the adverse influence of overdue goes to decline.
- 2. The coefficient of total resources is also negative which implies that with the increase in total resources of the PACs, overdue can decline.
- 3. It quite a general observation that with the increase in the total volume of loans issued, there more probability of the overdue and vice-versa. This observation is also consistent with the statistical inferences.
- 4. Though the above results are based on single internal forces (i.g Financial aspects of PACs) the significance of other variables (internal and external) that are included in the model cannot be disregarded.

VIII. CONCLUSION:

Increasing the capacity of cultivator-members of the cooperatives to repay their liabilities is the key to reduce the overdue position of the PACs. Efforts towards improving irrigation facilities, and switching on to a more favorable cropping pattern with stress on higher-income yielding crops are some important solutions to the growing problem of overdue. Along with an external strategy, a proper internal strategy has to be adopted by the PACs to overcome weaknesses like overdue. Improved management techniques, secretarial skills, and beliefs of the members will help in the strengthening of PACs in the modern competitive era.
